

FluctlightDB persistence and recall layout

One embedded directory per agent — experience() writes; activate() recalls

(a) Agent brain directory

```
manifest.json
hippocampus/  engrams
graph/        synapses
recall_index.sqlite
    FTS5 + vector blobs
*.wal -> checkpoint()
```

(b) Engram (logical unit) data model

```
content, context, outcome
provenance: kind, verified
rag: doc_id, chunk_id
semantic_vector (opt.)
graph neuron ensemble
```

Relational: typed rows,
no provenance recall
Vector DB: ANN top-k,
no episode graph

FluctlightDB: engram +
graph + hybrid index
in one contract

index

Recall sidecar

```
FTS5 lexical seeds
HNSW semantic seeds
```

(c) Write: experience()

```
separation gate
encode episode
wire graph
upsert sidecar
```

(d) Read: activate(cue)

```
lexical + semantic seed
graph spread (0-4 hops)
fuse scores
provenance boost
```

same store
